

Industrial Products

In addition to well-known uses of calcined petroleum coke (CPC) in the aluminum and TiO₂ industries, Rain CII produces material used in many specialty industrial applications, either directly or after further processing. These include:

- Cathodic protection and electrical grounding for underground construction
- Packing material for anodes during the baking process
- Carbon raiser used by the steel industry
- Electrodes for steel recycling

The steel industry uses CPC to help remove impurities from recycled steel by blowing it into electric arc furnaces. Many of these applications are directly related to recycling or sustaining product life and require energy to produce. These are good examples of how Rain CII products support a sustainable environment.
